CHRONOVIS

Advanced video analytics AI platform

Find what matters.
In seconds.

MADE IN EU

Search video like a database.

CHRONOVIS processes video into structured, searchable metadata. Search by attributes, similarity, tattoos, footwear and audio events.

CORE TECHNICAL CAPABILITIES

Forensic search
Natural-language and attribute-based search across indexed footage

Event-driven alerts
Rules and models trigger real-time notifications for defined activity

Audio analytics
Audio triggers (gunshots, shouting etc.) are searchable across time.

Detection & tracking
People, vehicles, shoes, tattoos and objects tracked across frames.

AI custom models
Custom models for hard tasks, trained using our proprietary process.

On-prem deployment
CHRONOVIS runs directly on your servers. No data is sent to the cloud.

VIDEO-TO-INTELLIGENCE PIPELINE

Ingest
Collect from any source

Normalize
Decode, timestamp and align

Analyse
Detect, classify and track

Index
Create searchable metadata

Act
Search, alert and review

PRIORITY LAW ENFORCEMENT USE CASES

Built for real-world investigations.

Investigations & evidence review

Compare footage across repeated visits or multiple cameras to reveal relocated items, personnel changes, disturbed evidence, and unusual access. Changes are surfaced automatically, so what shifted is clear without manual review.

Surveillance & tracking

Detect and track people, vehicles and objects across CCTV, body-worn, dashcam and drone footage. Identities are maintained across feeds, so a trail can be followed continuously rather than reconstructed after the fact.

Patrol & perimeter security

Detect perimeter intrusions, loitering, abandoned objects, unusual vehicle stops, repeated passes and suspicious movement around protected sites. Patterns are flagged as they build, so isolated behavior stands out once repeated.

MODULE SPOTLIGHT - TATTOO RECOGNITION

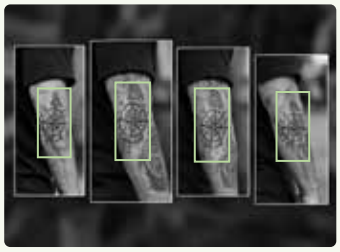

Tattoo evidence is often visible for only a few frames - at difficult angles, under motion blur or partial occlusion. CHRONOVIS links those fragments across video to create a stronger searchable signature.

Sample
Frames are selected by motion and person visibility.

Locate
A detector marks tattoo regions inside body areas.

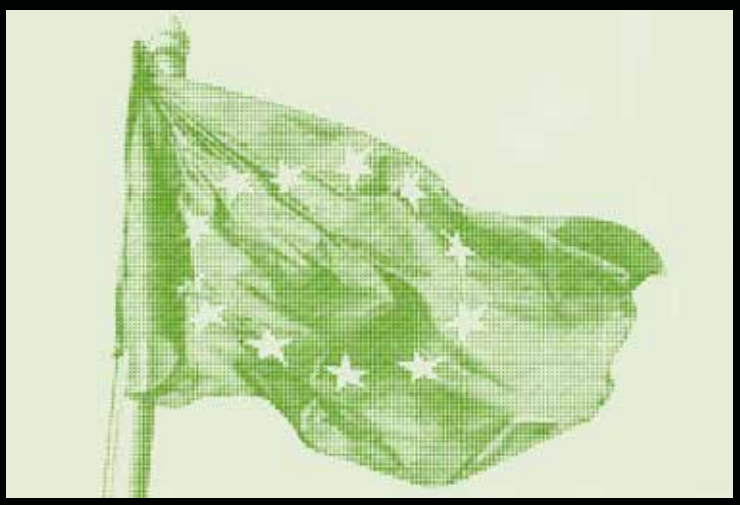

Link and fuse
Detections are joined across frames into one signature, weighted by crop quality.

Match
The signature is compared against an indexed gallery.

CHRONOVIS returns a ranked set of potential matches, each linked to the original footage, timestamp and supporting image evidence. When no reliable match is found, the system says so. The same approach can be adapted to other highly specific visual-identification tasks.

European AI.
Local control.

CHRONOVIS is built in-house in the Czech Republic for organizations that cannot compromise on data location, operational independence or integration control.

DATAVISION CREDENTIALS

20+
years in computer vision

30+
AI Experts

15+
countries served

100+
delivered projects

ABOUT DATAVISION

DataVision is a Czech computer-vision company developing proprietary AI, model-training pipelines and deployable visual-analysis software, including CHRONOVIS, MASKIT and video-first tattoo and shoe recognition.
